If you have any issue with this, kindly email me and I will remove it. Pentacyanoaluminate-Mediated Photoredox Alkylation of Alkenes via γ -H₂Sn(V) Elimination. A pentacyanoaluminate-mediated photoredox alkylation of alkenes is presented. Selectively alkylating both electron-rich and electron-deficient alkenes is achieved with a quinolium or a copper-catalyzed difluoromethylation reaction, respectively. Mechanistic investigations indicate that this transformation proceeds via photoredox-controlled γ -H₂Sn(V) elimination, a process previously unobserved in any pentacyanoaluminate-mediated
